Abstract

This progress log documents the development and execution of UGV: Bluetooth implementation during the period from [28-10-2026] to [01-11-2026]. The primary objective of this project is to make and assemble a UGV vehicle that operates via Bluetooth through esp32. Over the course of this tracking period

1 28-10-2026

We Collected the materials for the project today and went through the ugv repo cloned it in our devices and installed ugv voice app through apk file in the repo

.

2 29-10-206

we built the circuit today according tothe connections given the github repo provided and installed dabble.

3 30-10-2026:31-10-2026

We started setting up arduino ide in laptop and started codingand completed it we used d pad to control the car

4 01-11-2026

We used arduino to power esp32 and give 5 volt logic to the ic so it can be completley wireless no need to use cable for laptop then we used douuble tape and tied the jumpers Wrap up your paper's main points here.
